CC sequences of at least two different endogenous target genes in a moss of cell. The method comprises (a) introducing at least two different DNA CC constructs into a population of cells, using at least two different DNA CC each gene, where the construct has at least one sequence of sufficient CC length and homology to undergo homologous recombination with the CC chromosomal sequences and (b) selecting cells in which at least two genes CC the family Funariaceae, specifically Physcomitrella bruch, P. CC californica, P. readeri or P. patens. Typical of many genes that can be targeted are those that encode storage proteins, proteins of the CC californica, p. readeri or P. patens. Typical of many genes that can be targeted are those that encode storage proteins, proteins of the CC chomogentistate pathway, acetyltransferases, fatty acid desaturases, cthioesterases, phosphorylases, chalcone isomerases, cellulases and CC threosine synthase. The constructs have a linear, or linearised, cor reporter gene. The altered cells (or organisms regenerated from them) CC are used for production of food, animal feed, pharmaceuticals and fine C chemicals (e.g. enzymes, vitamins, amino or fatty acids, sugars, cellulases rapid and efficient alteration of many different cendogenous genes and colours, particularly triacylglycerols, lipids, CC oils, fatty acids, starch, tocopherols, tocotrienols and carotenoids). The method provides rapid and efficient alteration of many different cendogenous genes inultaneously, e.g. double knockouts are produced at a frequency of 4.8%. No interaction occurs between the different constructs. This sequence represents a probe used in the method of the

ADM15393/c
                                          The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mpGES-1; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder;

The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPCES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9344.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, necoprotective, antidiabetic, immunomodulator, cardiant, necoprotective.

The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpCES-1). The Chuman mpGES-1 gene is located on chromosome 9, more specifically to CC 9q34.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hbridise with the nucleic acid mpGES-1 and CC inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, cantisinse oligonucleotides and antisense compounds have cytostatic, cophthalmological, immunomodulator, cardiant, neuroprotective, antisinflammatory, neuroprotective, nootropic, antistanological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                            Query Match

The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic

The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic purposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents a primer used in the isolation of a Mycobacterium tuberculosis katG gene polynucleotide labelled with tetrachlorofluorescein (TET) used to demonstrate the

                                                                                                                                                                                                                                                                                                                                         The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present seguence represents a chimeric phosphorothicate oligonuclectide with
ADK79699 standard; DNA;
                                                                                                                                                                                                                                                                                        2'MOE wings and a deoxy gap. Used during the antisense inhibition of
human Nav1.3 expression, the oligonucleotides are designed to target
different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure
                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2004-203785/19.

                                                                                                                                                                                                                                                       The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2 MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                         Sequence

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipsae (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipsae in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                    Claim 4; SEQ ID NO 4285; 417pp; English

                                                                         specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            but not limited to neonatal or infantile epilepsy; or ataxia. The sequence represents a chimeric phosphorothicate oligonuclectide wi 2'MOE wings and a deoxy gap. Used during the antisense inhibition human Navl.3 expression, the oligonuclectides are designed to targ different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to an antisense compound targeted nucleic acid molecule encoding Nav1.3, where the antisense compo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4; SEQ ID NO 4748; 417pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition assoc with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diabetic neuropathy; arthritic pain;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonuclectide specifically hybridises with and inhibits the expression of EL. The antisense oligonuclectides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonuclectides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present ADJ25510)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel probe for hybridising to a target nucleic acid and detecting gene polymorphisms. The probe comprises a basequence that is complementary to the target nucleic acid and has at least one artificial mismatch and at least one original mismatch with respect to the target nucleic acid, where the artificial mismatch and original mismatch exist in different base positions. The probe of the invention may be useful for detecting genetic variation by gene amplification, mutation-specific DNA sequencing or a mutation-specific DNA chip, preferably for detecting a polymorphism in exon 2 of HLA-DRB1 The current sequence is that of a probe of the invention which was used to detect a polymorphism in human HLA-DRB1 exon 2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              respect

The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                    Homo sapiens.

ADJ59191/c
ID ADJ59191 standard; DNA;
                                                                                                                                          The present invention relates to an oligonucleotide anti-sense to e.g., clinitiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-ce end of nucleic acid target comprising gene(s) chosen from e.g. clinterleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a cc respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment cf of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded crespiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhintis (NR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway construction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś

                                                                                                                                                                                                                                The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human G protein-coupled receptor 6 (GPCR-6), which specifically hybridises with the nucleic acid encoding the GPCR-6 and inhibits expression of the GPCR-6. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the GPCR-6 and in preparation of a composition for treating a disease or condition associated with GPCR-6, e.g., a metabolic disorder, aberrant signal transduction in brain tissue, a neuronal, motor, sensory, psychiatric or behavioural disorder or drug or chemical addiction. This sequence represents an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound targeted to nucleic acids encoding G protocoupled receptor 6 (GPCR-6), useful for treating animal having discassociated with GPCR-6 e.g. metabolic, neuronal, motor, sensory or

                                initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy (ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway that the control of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 phosphatase activator, preferably hyperproliferative disorder or developmental disorder. The compound can also be used as prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. present sequence is a human PTPA antisense oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 2121
                                        The present invention relates to an oligonucleotide anti-sense to e.g., CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end and of nucleic acid target comprising gene(s) chosen from e.g. CC interleukin (IL)-4 receptor, IL-5 receptor or salts of the cligonucleotide and optionally surfactant operatively linked to the CC oligonucleotide. The method is useful for preventing or treating a CC respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is CC useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is CC chosen from airway inflammation, allergy(ies), asthma, impeded chosen from airway inflammation, allergy(ies), asthma, impeded crespiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CC chosen from airway inflammation, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                             This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; an T3 promoter site; at least one Tag gene comprising at least 5 20mer Tag sequences; a Poly A site having at least 21 consecutive A residues; a second restriction endonuclease site which may be the same or different than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                   New DNA molecules made by annealing and extending overlapping oligonucleotides, useful in producing synthetic Tag genes usef controls, in assay development, product development and for que

CC to a nucleic acid molecule encoding phosphotyrosyl phosphatase activator compound of antisense compound. The disease or condition is antisense compound. The disease or condition is antisense compound. The compound can antisense compound. The disease or condition is a hyperproliferative of antisense compound. The disease or condition associated compound. The disease or condition is a hyperproliferative compound. The disease or condition is a hyperproliferative compound of cardieontal disorder. The compound, particularly the contisense compound can also be used as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used as tools in differential analyor combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used as tools in differential analyor combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 2119
                                                                                                                                                                                                                                                                                                                                                                    New antisense compound targeted to a nucleic acid molecule encoding phosphotyrosyl phosphatase activator, for modulating expression of phosphotyrosyl phosphatase activator or treating hyperproliferative
                                                                                                                                                                                                                                                                                                                      Example
                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2004-132607/13.

The compound specific phosphatase 4 and inhibits the expression of dual specific phosphatase 6 and inhibits the expression of dual specific phosphatase 6. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding dual specific phosphatase 6. The antisense oligonucleotide is useful for inhibiting the expression of dual specific phosphatase 6 in cells or tissues to treat diseases associated with their expression, suc as a hyperproliferative disorder, a condition arising from aberrant apoptosis, an inflammatory disorder or a developmental disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human dual specific phosphatase 6 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20

                                                                                                   The present invention relates to antisense compounds, compositions and methods used for modulating the expression of haem oxygenase (HO) 1. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of haem oxygenase 1 such as hyperbilirubinaemia, neonatal jaundice and neurodegenerative diseases like Alzheimer's and Parkinson's diseases. The invention is also useful in antisense-therapy. The present sequence is human haem oxygenase 1 antisense oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                            preventing and/or treating conditions with aberrant activity of heme oxygenase 1, such as hyperbilirubinemia, neonatal jaundice and neurodegenerative diseases.

New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of oxygenase 1, such as hyperbilirubinemia, neonatal jaundice and neurodegenerative diseases. WPI; 2004-070587/07. (ISIS-) ISIS PHARM INC

The present invention relates to antisense compounds, compositions and methods used for modulating the expression of haem oxygenase (HO) 1. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of haem oxygenase 1 such as hyperbilirubinaemia, neonatal jaundice and neurodegenerative diseases like Alzheimer's and Parkinson's disease. The invention is also useful ir antisense-therapy. The present sequence is human haem oxygenase 1 target Example 15; SEQ ID NO 54; 43pp; English

                 a nucleic acid molecule encoding dual specific phosphatase 6. The compound specifically hybridises with the nucleic acid molecule encoding dual specific phosphatase 6 and inhibits the expression of dual specific phosphatase 6. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule
                                                                                                                                                                                                                                New antisense oligonucleotides for modulating dual specific phosphatase expression, useful for diagnosing, preventing or treating conditions associated with the phosphatase, e.g. hyperproliferative or inflammator.
                                                                                                                                The invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC PIDRM. The invention may be useful for the production of compositions of with a cytostatic or antidiabetic activity. In addition, the disclosed sequences may be useful for gene therapy. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding PIDRM. The antisense compound can also be used as cresearch tools and diagnostics. It can also be used as tools in the compound can also be used as creating and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within constituents associated with PIDRM, preferably hyperproliferative disporder, for example cancer or metabolic disorders, for example diabetes. The compound can also be used as prophylaxis, for example to prevent or delay infection, inflammation or tumour formation. The present sequence is that of a human DNA sequence which is a target for antisense therapy and which constitutions as used during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Coenzyme A (HWG-COA) reductase, and inhibits the expression of HWG-COA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HWG-COA reductase. This

Example 16; SEQ ID angiogenesis.

The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a disease or condition associated with HMG-COA reductase, such as a disease or condition associated with HMG-COA reductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-COA reductase. This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Construction of a target polypeptide associated with lung airway or lung construction or cancer and can be anti-sense to the corresponding mRNA. Construction also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery construction for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, considered in the invention as antiallergic, antiinflammatory, antiasthmatic, consposition comprises oligo and is administered to reduce the production of treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confirmmation, allergies, asthma, impeded respiration, respiratory confirmmation, allergies, asthma, impeded respiration, respiratory transplantation respires, chronic obstructive pulmonary disease, pulmonary transplantation respection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligomation and the target RNA serves to prevent the breakdown of the oligomation in the target RNA serves to prevent and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

문 S

or diabetes or modulating expression of protein tyrosine phosphatase receptor type $\mathtt{mu}\,.$

protein tyrosine phosphata or diabetes or modulating

type

₹.

2004-121596/12.

New antisense compound targeted to a nucleic acid molecule encoding

phosphatase receptor

expression

r type mu, useful for treating configuration of protein tyrosine phosphatase

cancer

Example 45; SEQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel compound with an oligonuclectide 8-80 nuclectides in length targeted to a nucleic acid molecule encoding protein tyrosine phosphatase receptor type mu (PTPRM) which specifically hybridises with the nucleic acid molecule encoding PTPRM and inhibits the expression of PTPRM or specifically hybridises with at least 8-nucleotide portion of a preferred target region on a nucleic acid molecule encoding PTPRM. The invention may be useful for the production of compositions with a cytostatic or antidiabetic activity. In addition, the disclosed sequences may be useful for gene therapy. The compound, particularly the antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding PTPRM. The antisense compound can also be used as research tools and diagnostics. It can also be used as tools in differential and/or combinatorial analyses to elucidate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           patterns of a portion or the entire complement of genes expressed within cells and tissues. The compound can also be used for treating diseases or conditions associated with PTPRM, preferably hyperproliferative disorder, for example cancer or metabolic disorders, for example diabetes. The compound can also be used as prophylaxis, for example to prevent or delay infection, inflammation or tumour formation. The present sequence is that of an antisense oligonucleotide which may be used during the creation of a compound of the invention.
                                                                                                                                                                                                                                                                                                                                                                                             protein tyrosine phosphatase receptor type mu; PTPRM; cytostatic; antidiabetic; gene therapy; expression pattern; hyperproliferative disorder; cancer; metabolic disorder; diabetes;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 2108
ABD24118/c
comprising oligonucleotides, effective for alleviating controlled to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered correduce the production to availability, or to increase the degradation of the target mRNA or to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targe nucleic acids associated with lung airway or lung dysfunction,

targeted

ő

and

reducing adenosine surfactant depletion

bronchoconstriction, comprising oligonucleotides,

allergies (A) or (A) ered to a n

(A) receptors, a mammal. The

invention

a novel

composition

(a)

дJ

first active

agent,

Claim 15;

SEQ

ID NO 3429; describes

763pp; English.

bronchodilating

agent.

The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

respiratory tract

inflammation; adenosine sensitivity; lung; cancer;

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating allergies and composition, respiratory tract inflammation, allergies and crediting adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

Composition of a target polypeptide associated with lung airway or lung compression of a target polypeptide associated with lung airway or lung composition or cancer and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung lungularity and a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or bronchoconstriction and/or lung lungularity and administered with a disease or condition such as pulmonary vasoconstriction, pulmonary pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the sense to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc., tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nyce JW, L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 surfactant depletion; antiallergic; antinflammatory; antisthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory discress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and ç

Claim 15; SEQ ID NO 13283; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, respiratory tract inflammation, allergies and creding adenosine ensitivity, levels of adenosine (A) or (A) receptore, considered in the ensity of the encoding or regulating conting depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating conting the invention or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analysic, hypotensive, immunosuppressive and cycostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The gulmonary obstruction, and/or burnfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, respiratory childs respirator, emplyseems, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the middines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system content of the after endenosine into the system

                                                                                                                                              The invention comprises DNA sequences which are associated with intestinal epithelium and peyer's patch M cells. The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), alseases or disorders of the immune system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents a PCR primer that was used to amplify an intestinal epithelium/peyer's patch M cell-associated DNA sequence of the invention.

The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents, a PCR primer that was used to amplify an intestinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated or purified polypeptide encoded by genes associated with intestinal epithelium or M cell development, differentiation or function useful for treating autoimmune diseases and infectious diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inflammatory bowel disease; glutenentero autoimmune disease; haemolytic anaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 2102
                   The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cantiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cycostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or antiinflammatory starting bronchodilation, increasing levels of ubiquinone or preventing and composition is used to be adenosine or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

                                The present invention relates to antisense oligonucleotides (ADA66459-ADA6669), which inhibit Transforming Growth Factor (TGF) beta-3 expression. The oligonucleotides are useful for inhibiting the expression of TGF-beta3 in cells or tissues, and for treating an animal having a disease condition associated with TGF-beta3, e.g. a hyperproliferative disorder such as cancers of lung, liver, colon, oseophagus, pancreas, breast, skin or haematopoietic, atherosclerosis, rheumatoid arthritis,
                                                                                                                                                        Novel antisense compound which is targeted to nucleic acid transforming growth factor beta-3, and inhibits expression useful for treating a condition associated with TGF-beta 3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; antirheumatic; antiarthritic; gynecologica antiarteriosclerotic; Transforming Growth Factor beta-hyperprolifierative disorder; cancers; atherosclerosls; rheumatoid arthritis; preeclampsia; fibrosis; phosphor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lung inflammation, lung allergies, or a respiratory disease or Note: The sequence data for this patent is not represented in t specification, but was obtained in electronic format directly f at ftp.wipo.int/pub/published pct sequences

                                                                                                                                                           The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' and 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or
                 preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lung inflammation, lung allergies, or a respiratory disease or condition. CC The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, 6' cC or end 3' intron-exon junctions, or regions within 2-10 nucleotides of 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of 6' cC or end 3' intron-exon and a second active agent comprising an 6' cC or entiinflammatory, antiallergic, antiasthmatic, hypotensive, 6' cC or end antiinflammatory, and cytostatic activity. The composition may have a 6' cC or enhancing the prophylactic or therapeutic respiratory effect of an 6' cC or reducing sensitivity to adenosine, reducing levels of adenosine 7' cC or reducing sensitivity to adenosine, reducing levels of adenosine 6' cc ceptor, producing bronchodilation, increasing levels of ubiquinone or 1 lung surfactant in a subject's tissue, or treating bronchoconstriction,

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or consal airway dysfunction and a second active agent comprising an cantinflammatory steroid and ubiquinone. A composition of the invention chas antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cycostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also correducing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2098

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
```

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation ocdon, coding region, or regions within 2-10 nucleotides of Unctions of genes encoding a polypeptide associated with lung and/or comparison of genes encoding a polypeptide associated with lung and/or compass a lairway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or receptor, producing bronchodilation, increasing levels of ubiquinone or contriction.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

New isolated NOVX polypeptides and preventing, diagnosing or treating

polynucleotides, useful for NOVX-associated disorders,

e.g.

The present invention relates to a method for evaluating the sensitivity of a cell to an anticancer agent. The method involves identifying a gene polymorphism in the human BCRP gene (the polymorphism is undefined in the specification). The gene polymorphisms encode variant BCRP polypeptides designated as Q141K, V12M and Q128STOP. Identifying the gene polymorphism of BCRP of a test cell is useful for evaluating the expression grade of the side effect at the time of administering an anticancer agent to the test cell and evaluating the resistance of the test cell to the

polymorphism

the

Evaluating sensitivity of test cell to anticancer identifying gene polymorphism of BCRP.

                                   Ş
                                                                                                                                                                                          The present sequence is that of a reverse primer for polynucleotide NOV3b (gene CG92035-01 ADD93533), identified as C1q-related factor. The primer CC was used in a primer-probe set to examine expression of the CG92035-01 CC gene in different screening panels. The invention is based on the CG identification of proteins and polypeptides, and the nucleic acids CC encoding them, that are differentially modulated in a pathological state, CG disease or an abnormal condition or state. These are target for CC therapeutic agents and can be used in screening methodologies to identify CC candidate therapeutic agents which interact with the target and thereby CC exert a desired or favourable effect, e.g. in neurogenesis, cell CC differentiation, cell proliferation, haematopoiesis, wound healing and CC disorders involving the novel human nucleic acids and proteins are CC provided. The nucleic acids are further used in gene therapy, as CC hybridization probes and primers, in chromosome mapping, tissue typing, or construction and pharmacogenomics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                  The present invention describes a method for predicting marbling in CC bovine comprising identifying a haplotype that is predictive of marbling, CC where the haplotype comprises a single nucleotide polymorphism (SNP) at CC nucleotide 244 and/or 575 of the bovine somatostatin (SST) gene. Also CC described is a method for predicting a trait in bovine comprising CC identifying a haplotype that is predictive of the trait, where the CC haplotype comprises a SNP at nucleotide 244 and/or 575 of the bovine SST CC gene, and the trait is selected from yearling weight, actual fat CC thickness over 10th and 11th rib, quality grade, connective tissue, CC flavour and juiciness. The methods can be used for identifying a used for CC predicting marbling in bovine. Identifying a trait in bovine, CC e.g. yearling weight, actual fat thickness over 10th and 11th rib, CC e.g. yearling weight, actual fat thickness over 10th and 11th rib, CC e.g. yearling weight, actual fat thickness over 10th and 11th rib, CC is used for selecting breeding bovines to produce offspring that exhibit CC increased marbling. The methods are useful for determining breeding CC increased marbling. The methods are useful for optimising the management conductive of increased marbling characterisetics of livestock progeny, and for optimising the management conductive. The present sequence represents a PCR primer for bovine SCT which is used in an example from the present invention. The bovine SCT which is used in an example from the present invention.

                                                            The invention relates to a substantially purified amino acid sequence comprising at least a portion of human calcium channel alpha2delta subunit splice isoform 1, splice isoform 2 sequence or splice isoform 3, or their variants, and their encoding nucleic acids (or their complements, variants, or homologues). Also included are screening a test complements, variants, or homologues). Also included are screening a test compound for modulating calcium channel activity, an antibody which binds to the calcium channel or its variants and producing a transgenic non-human animal (where the animal expresses a reduced level of calcium channel proteins are useful for generating an animal. The calcium channel proteins are useful for generating an antibody (which is useful for detecting the proteins or their portions). The transgenic animal (preferably a rodent e.g. mouse) is useful for identifying a therapeutic compound for treating a transgenic animal having cancer, sepecially lung cancer (small calcium or non-small cell carcinoma), breast cancer, nasopharyngeal cancer, cervical cancer, head and neck cancer, a neurological disease, especially epilepsy, any other proteins are describled and the cancer, and an animal cancer (sepecially epilepsy, brain trauma, Alzheimer's disease, multiinfarct dementia, any other cancer, and convoltations, seizures. Huttington's
                                                                                                                                                                                                                                                                                                                                                                                                                                                       New substantially pure human calcium channel alpha2delta subunit splice isoform 1, 2 and 3 sequence useful in preventing, treating and diagnosing cancer, neurological disorders and cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transgenic; cancer; lung cancer; small cell carcinoma; epilepsy; non-small cell carcinoma; breast cancer; nasopharyngeal cancer; cervical cancer; head and neck cancer; neurological disease;

                                    The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        congestive heart failure; or Lambert-Eaton myasthenic syndrome. The proteins and nucleic acids are useful in the diagnosis, prevention and proteins and the above mentioned diseases. The human gene for the calcium channel is located on chromosome 3p21.3. The present sequence is an SSCP (single strand conformation polymorphism) and reverse transcriptase (RT)-PCR primer used to detect and amplify polymorphic regions of the calcium
                                                                                                                                                                                                                                         New antisense compounds, useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha, and for treating a disease or condition associated with expression of PKA regulatory subunit RII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACD44777 standard; DNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
